

Contact list App

For my third project, i would like to create a contact application for users. The reason why i am creating this app is because we keep information about the people we talk to. For example, on our mobile phones, we can add, edit, update and delete contact. It is the same intention that i would like to do for my project. It is simple and straight forward. Therefore, in order to create this project, i will use HTML, CSS, JavaScript and Python, For HTML and CSS, i will use a template to materialize from Materialize CSS.

Site map for the Contact App

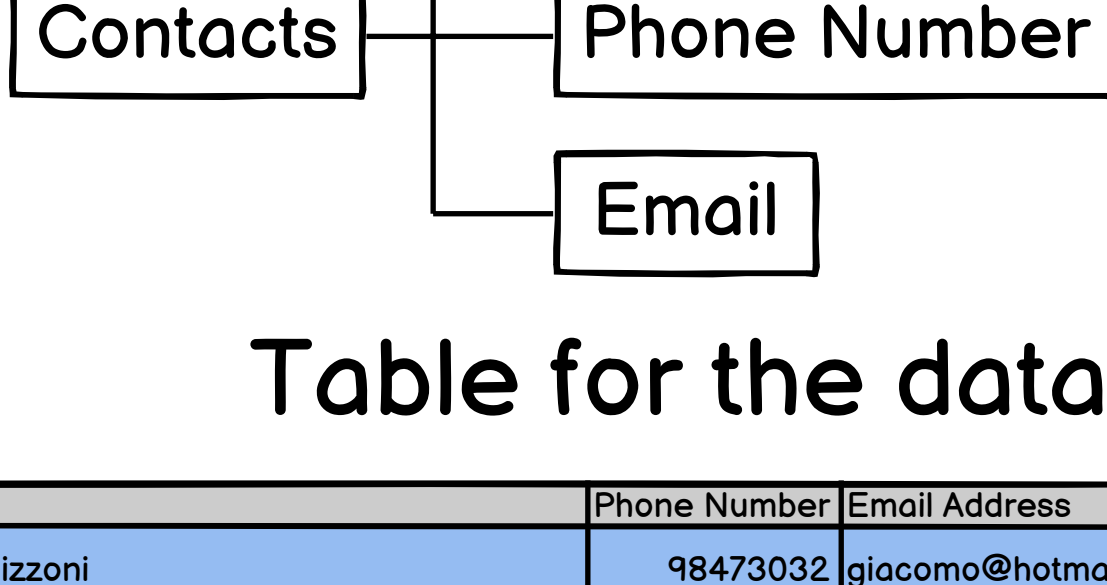

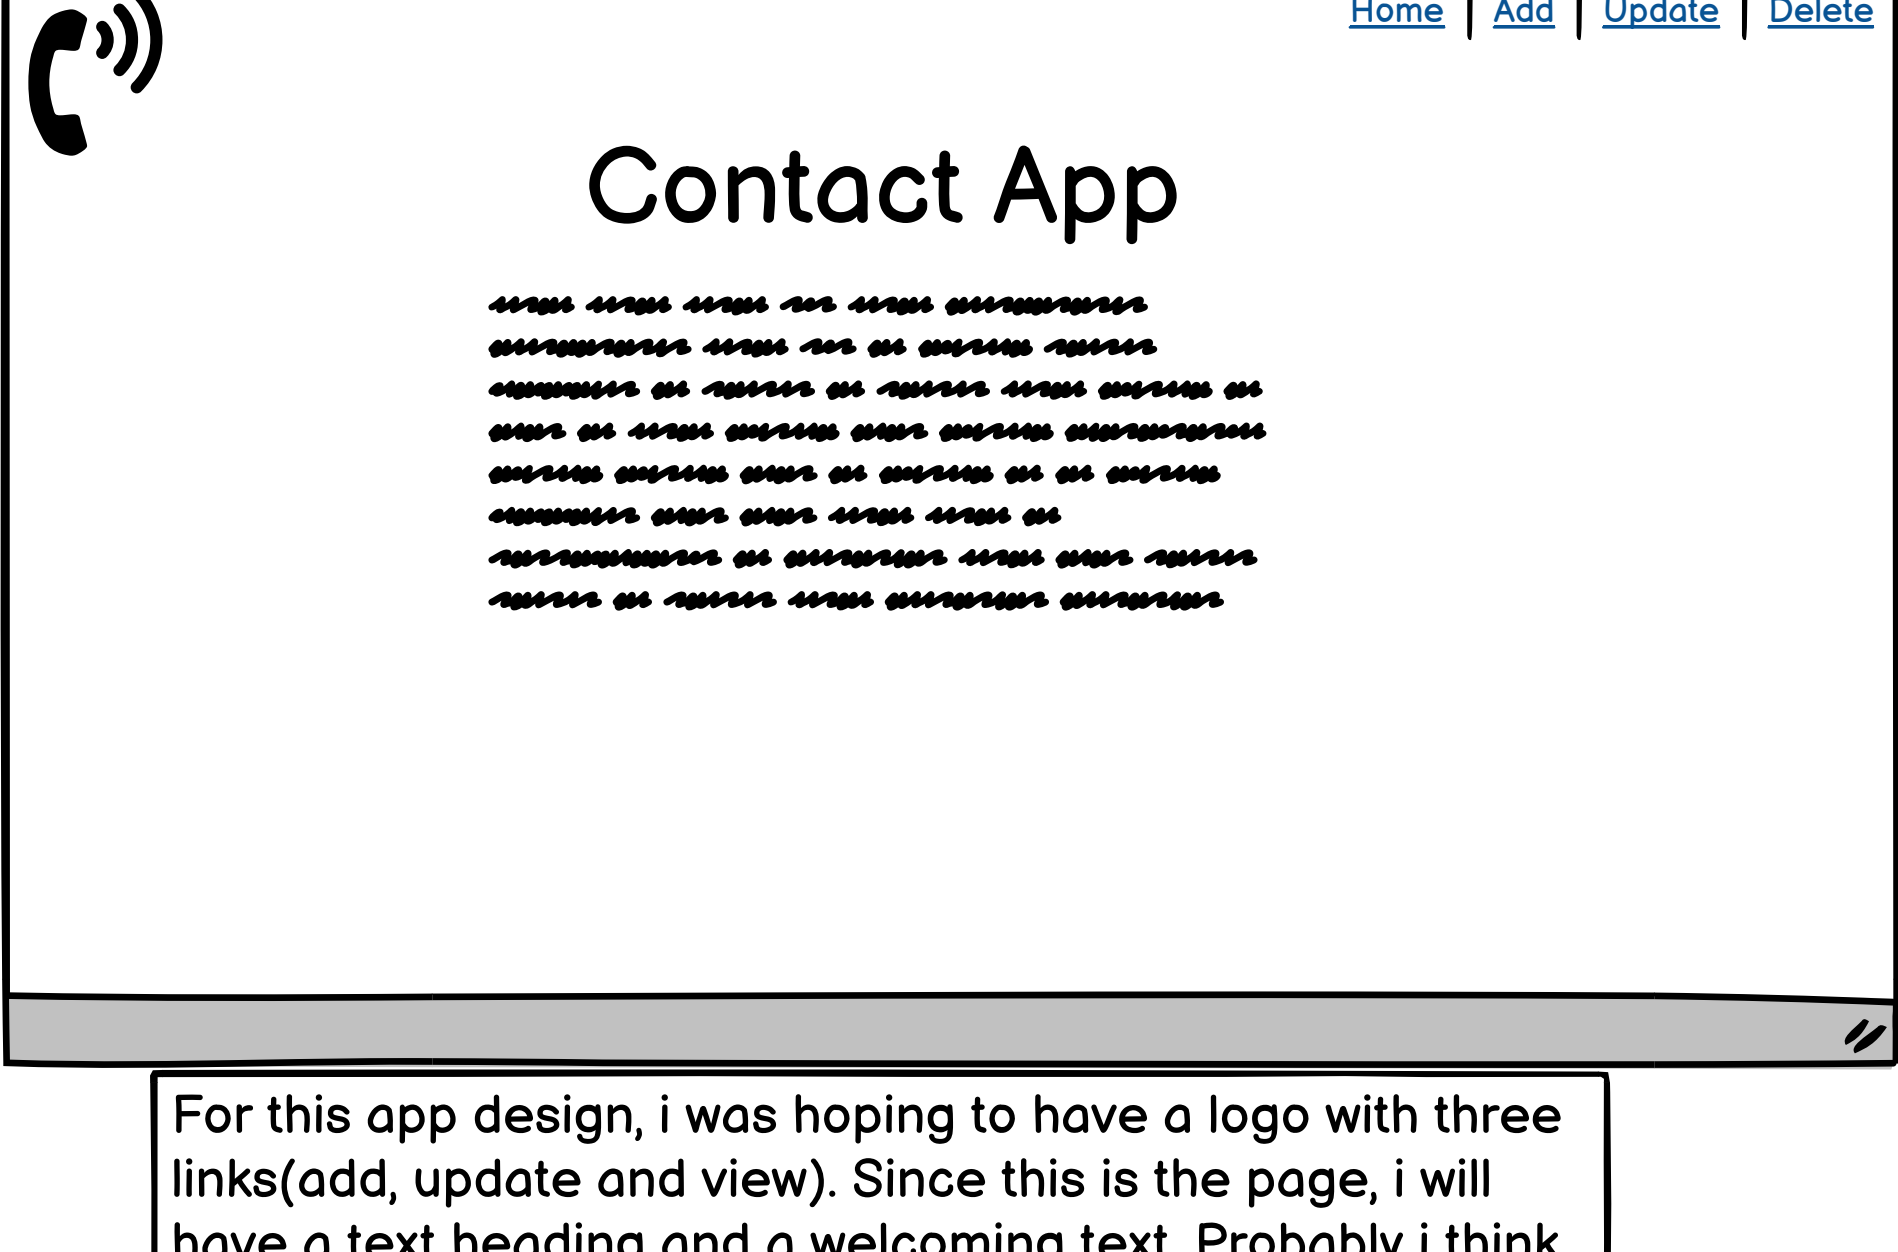

Table for the database

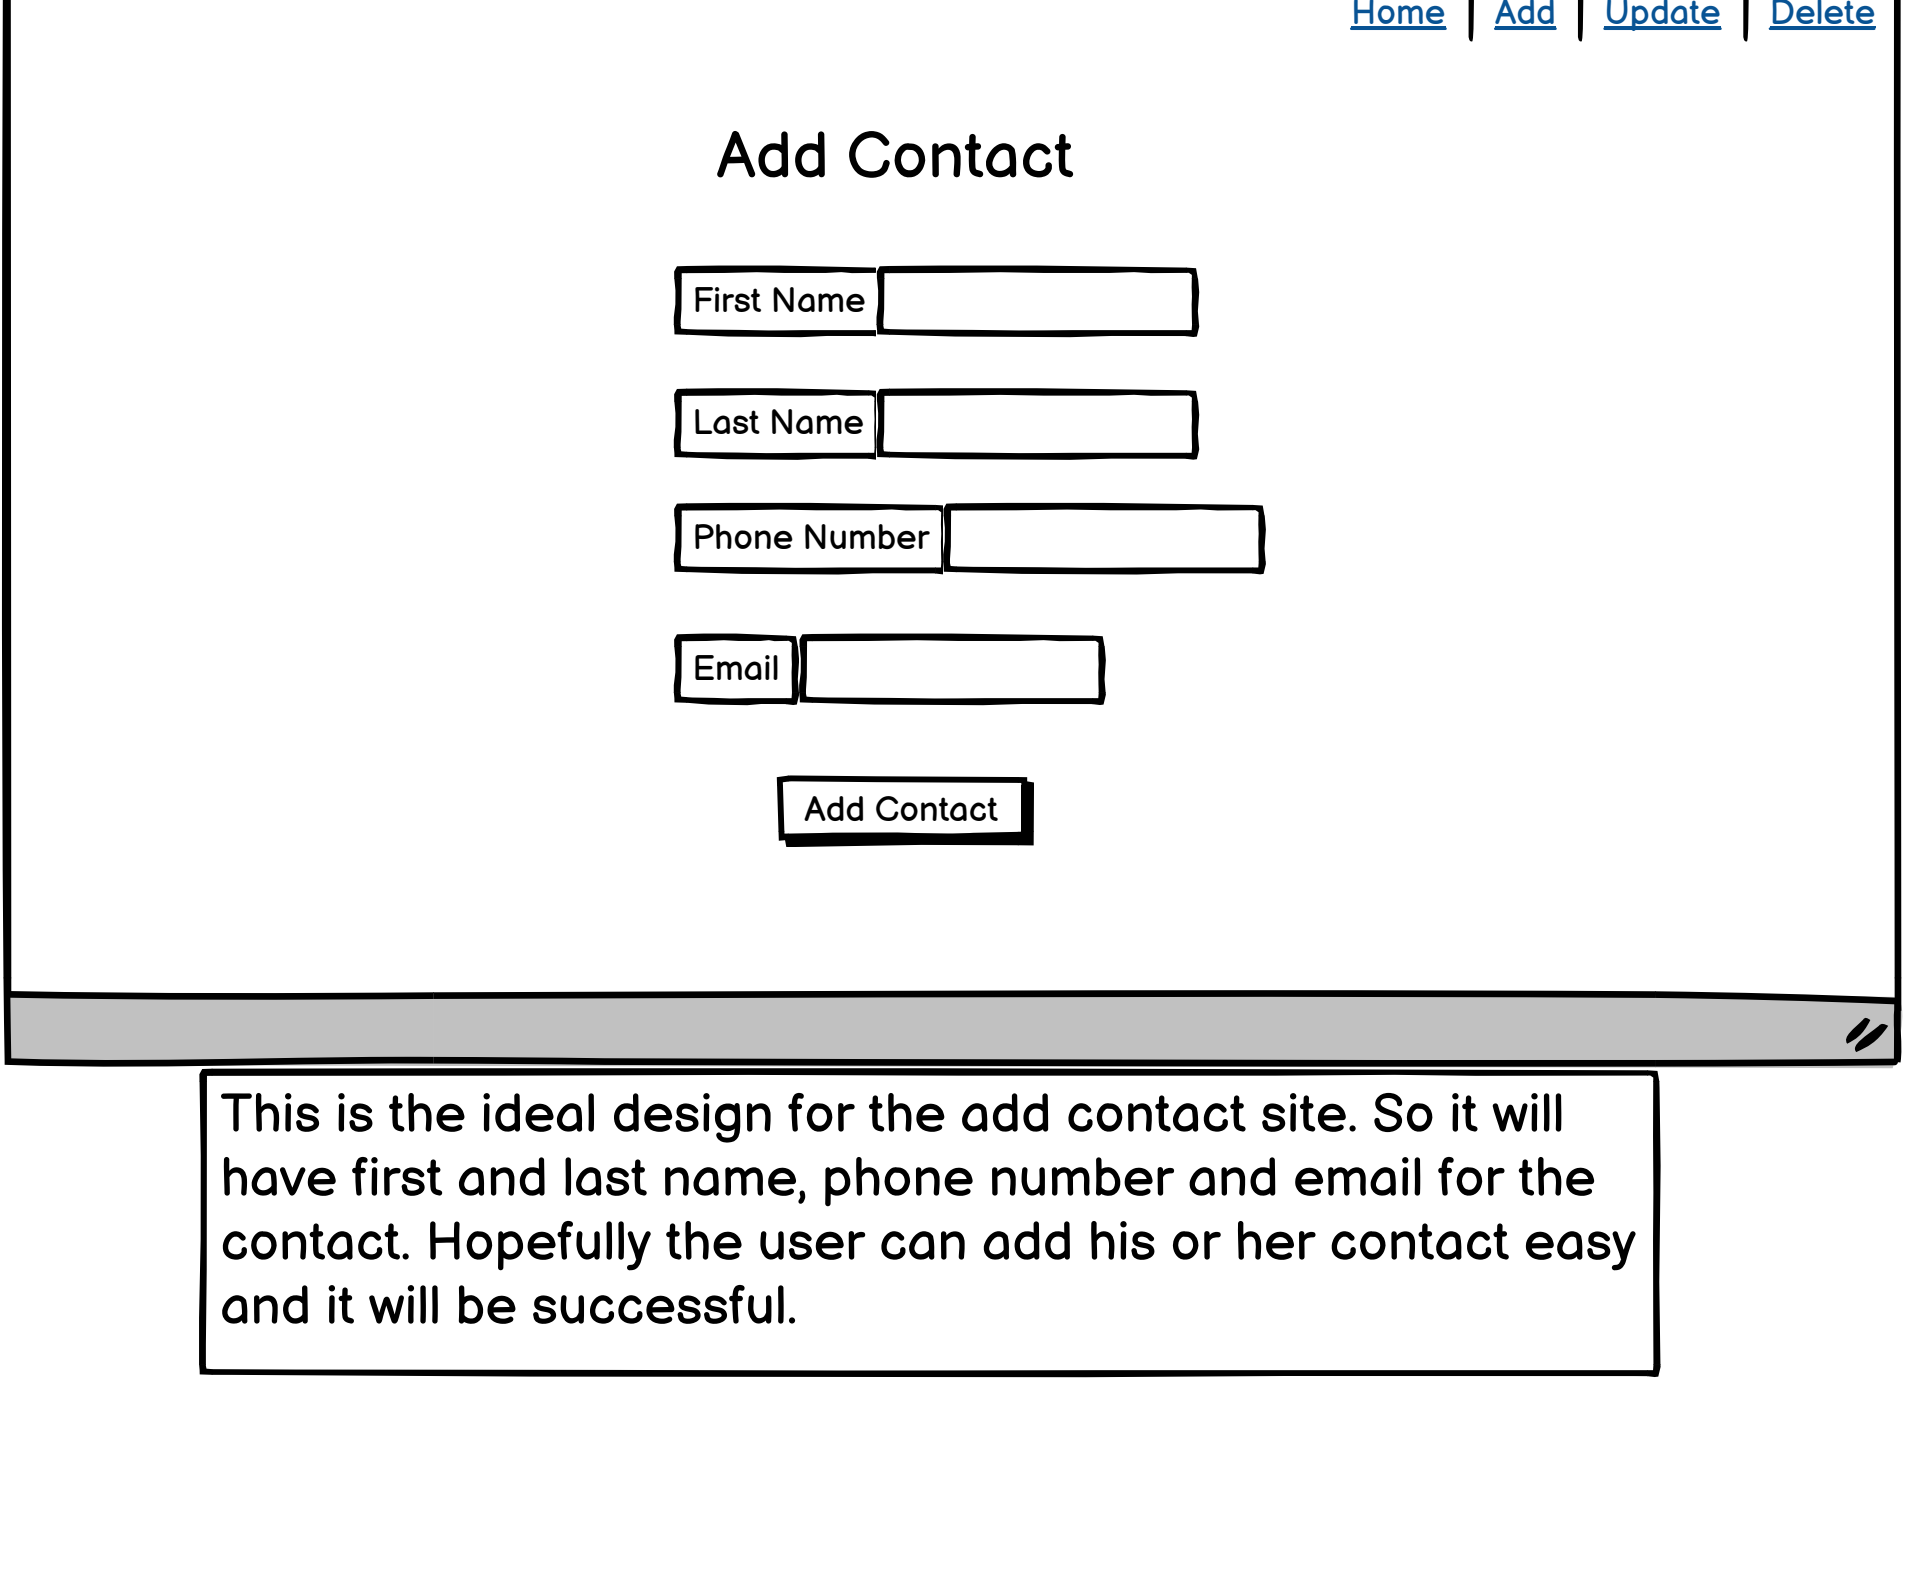

Name	Phone Number	Email Address
Giacomo Guillizzoni	98473032	giacomo@hotmail.com
Marco Botton	36428748284	marcob@yahoo.com
Mariah Maclachlan	3279244812	mm@hotmail.com
Valerie Liberty	2984939389	vliberty@gmail.com
Guido Jack Guillizzoni	3847293939	gjguillizzoni@icluod.co

As you can see, my table will consist three things: the name of the contact, the email address of the contact and the phone number of the contact. This database will store these information so that we can keep them and store them.

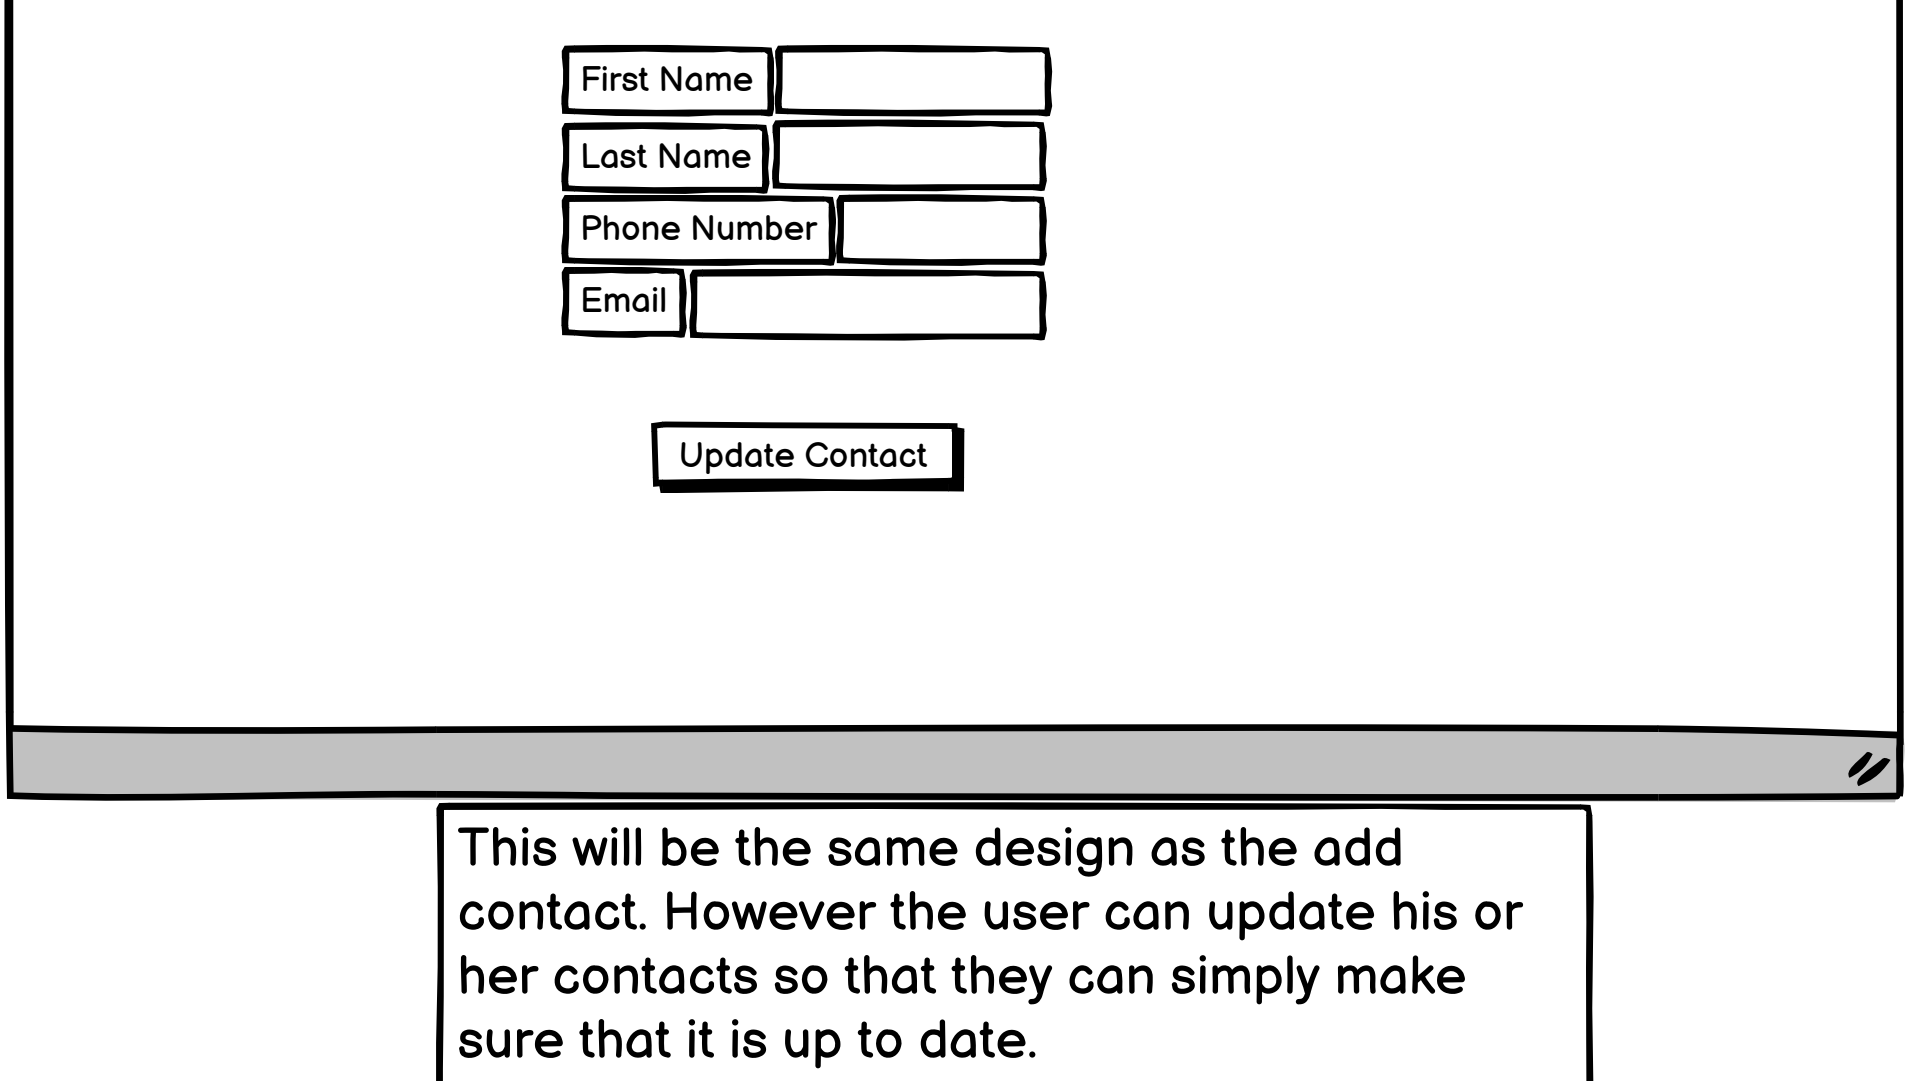

App Designs

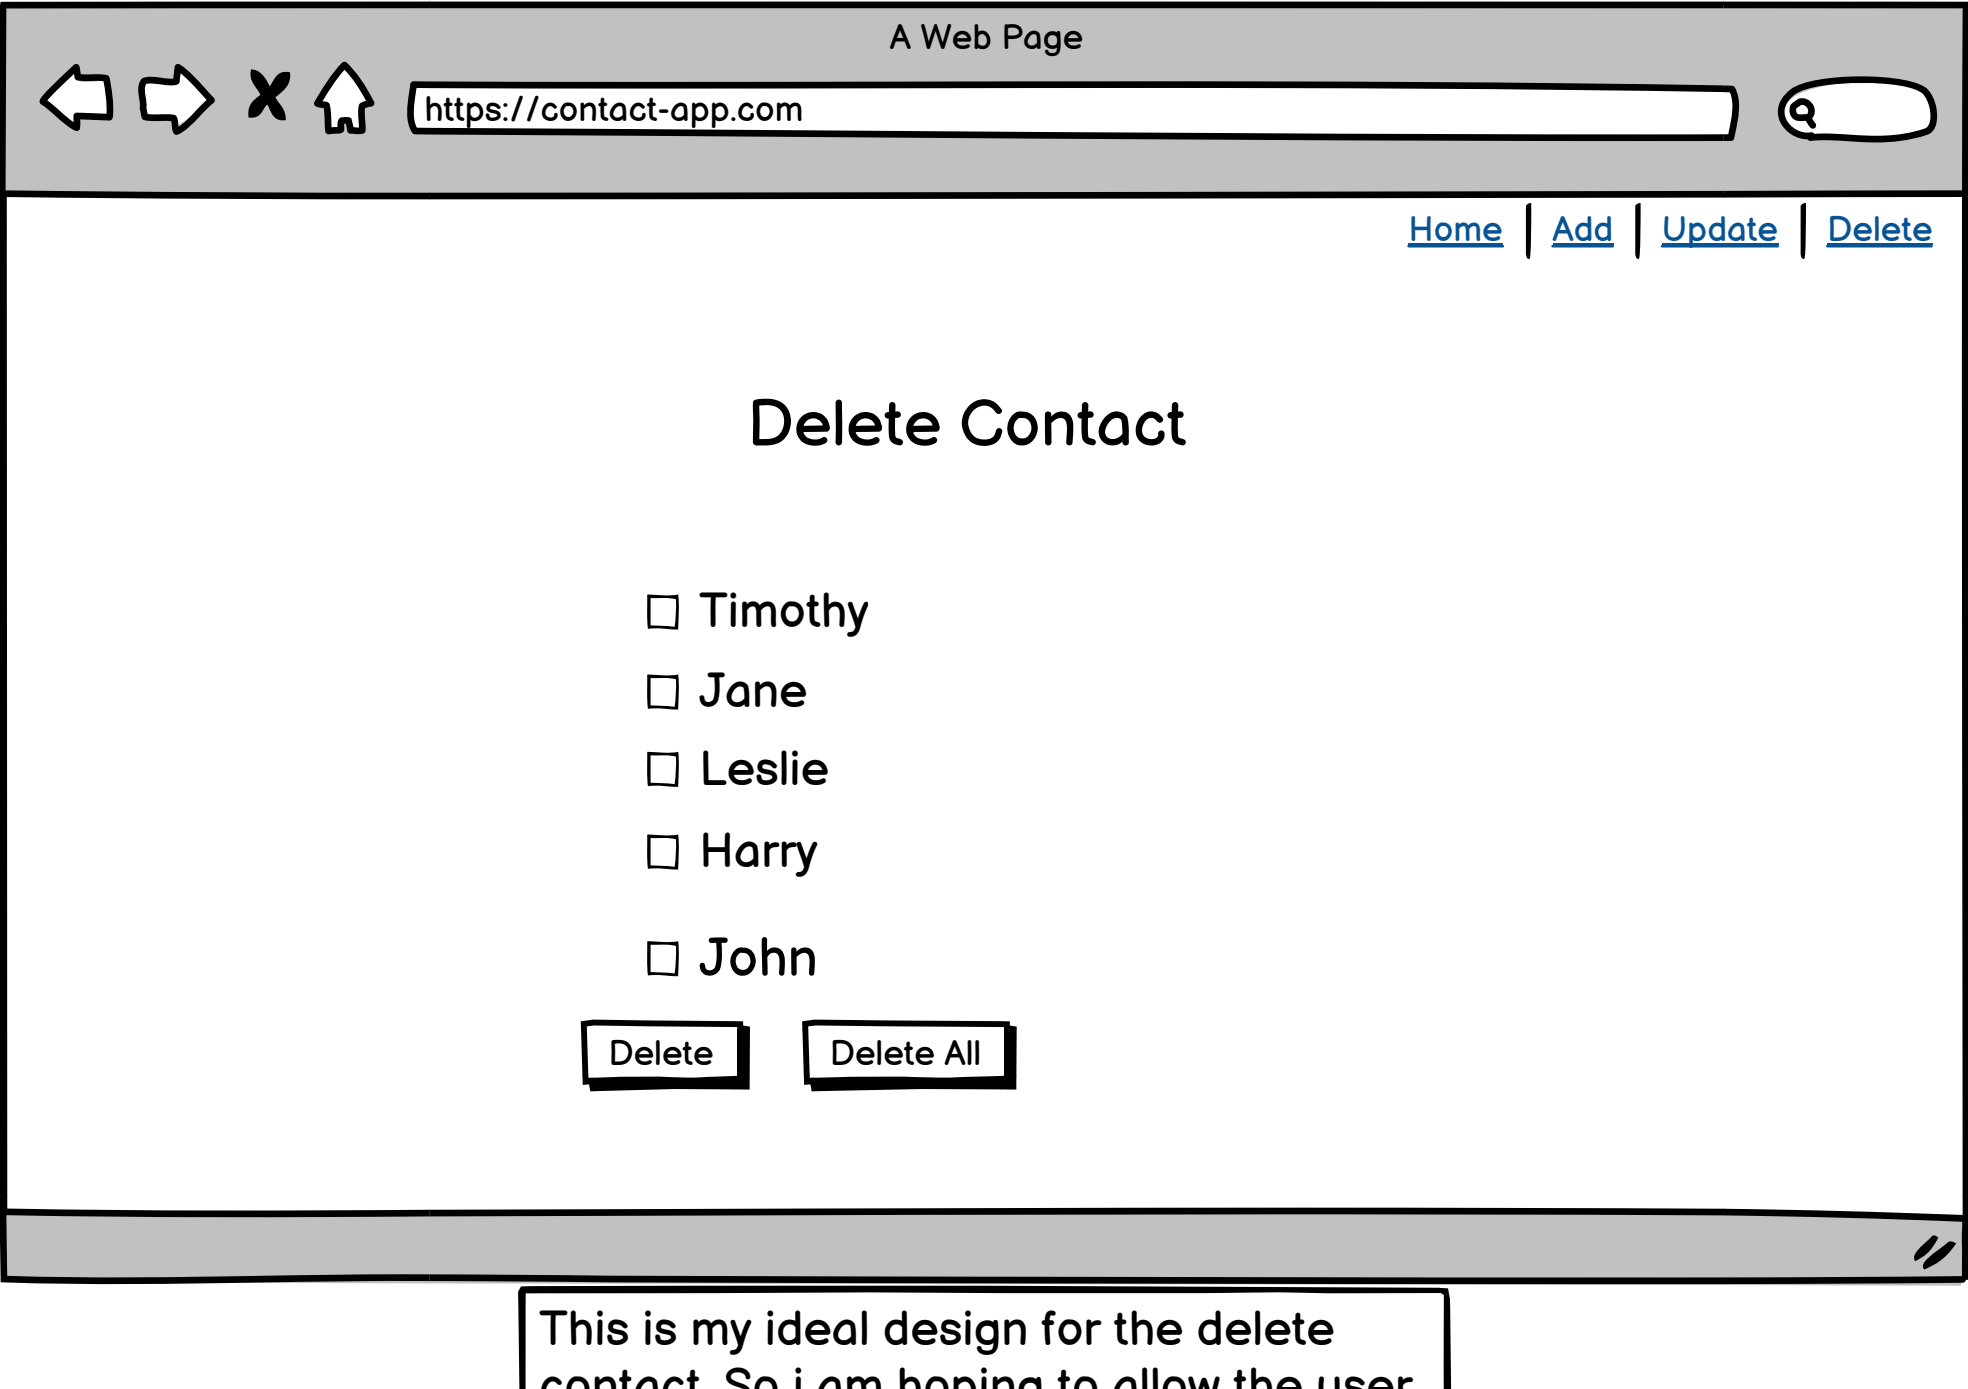

For this app design, i was hoping to have a logo with three links(add, update and view). Since this is the page, i will have a text heading and a welcoming text. Probably i think about having just the heading only. Finally there will be a search button so that the user can find the name of the contact.

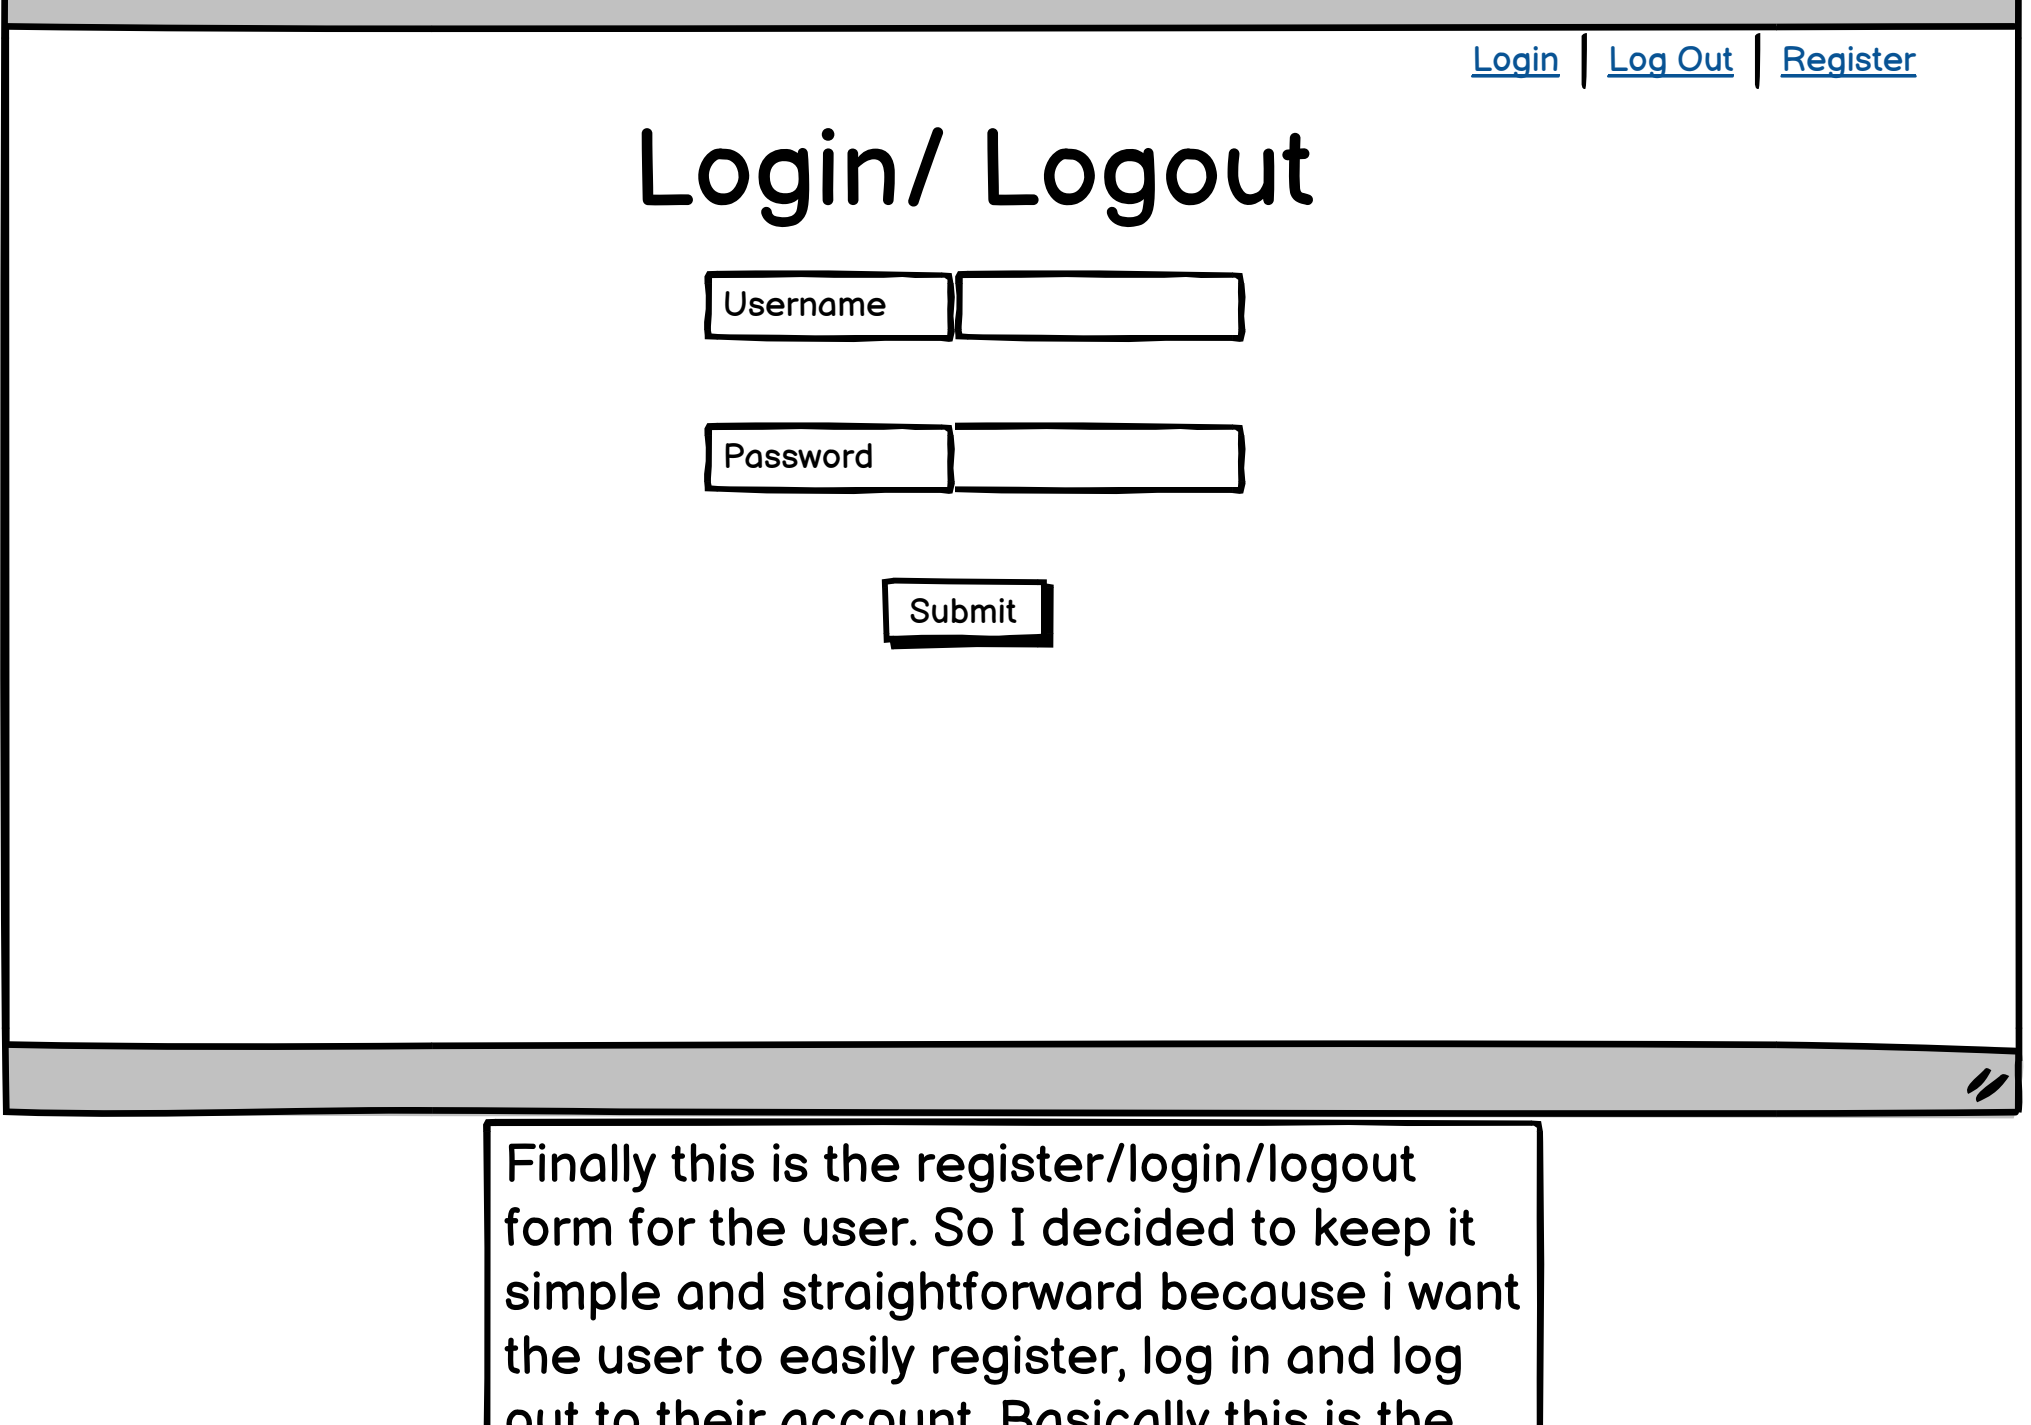

This is the ideal design for the add contact site. So it will have first and last name, phone number and email for the contact. Hopefully the user can add his or her contact easy and it will be successful.

This will be the same design as the add contact. However the user can update his or her contacts so that they can simply make sure that it is up to date.

This is my ideal design for the delete contact. So i am hoping to allow the user to have an option whether to delete one of its contact or delete all of its contacts with the checkbox.

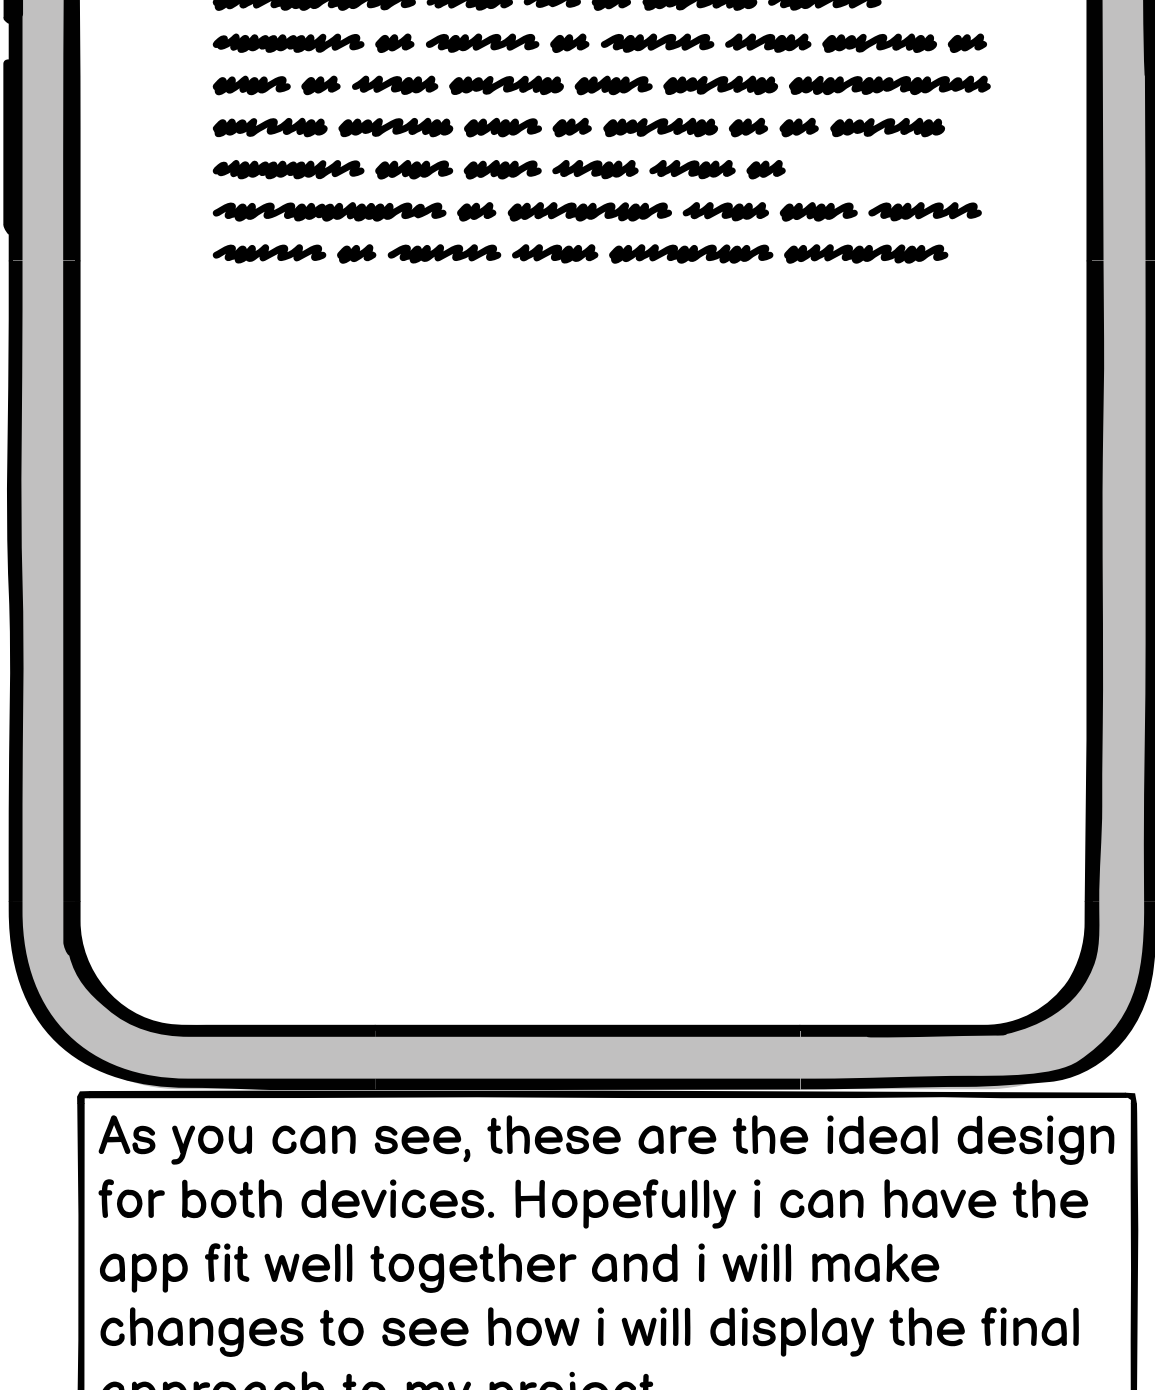

Finally this is the register/login/logout form for the user. So I decided to keep it simple and straightforward because i want the user to easily register, log in and log out to their account. Basically this is the final design for these forms

Contact App on different devices

On the iPad

On the iPhone

As you can see, these are the ideal design for both devices. Hopefully i can have the app fit well together and i will make changes to see how i will display the final approach to my project.

Conclusion

To conclude, My purpose is to be able to create an app that the user is able to create, edit, update and delete a contact. As i said before, this project will be simple and straight forward.
